Buyers guide to E-Stim

What do I buy?

We are often asked what should you buy. Although we don't know everything we do have some experience as we have been designing and manufacturing our own range of E-Stim equipment both online and at various events around the UK for the past 4 years.

What is it?

E-Stim or electro stimulation, (sometimes also referred to as 'electrosex'), is basically the use of electricity applied to the human body in such a way to produce a pleasurable (normally) sensation. The levels of stimulation and the methods of generation all combine to produce a unique experience far surpassed by anything produced by any funny coloured vibrator.

Equipment available on the market today is either TENS units (the medical use of E-Stim for pain relief) or made for play dedicated units. TENS units are designed to reduce pain and sensation so will always be inferior to 'made for play' equipment. We produce a range of safe versatile made for play equipment, that far surpasses its competitors both in functionality and price, and there is an extra difference. All of our staff actively play with our equipment, both in research and development terms and in their personal lives. So when we offer advice its from personal knowledge and experience. We also have a very active test team made up from customers, as well as, a policy of always listening and striving to continually improve our products and service.

E-Stim equipment is basically two items. The control box, and an electrode. Everything else is considered to be ancillary, but important nevertheless. (Batteries, cables, conductive gel etc.)

There is no need to purchase everything at one. In our experience the purchase of a control units and possibly one or two electrodes is an ideal start once you get used to everything more accessories will be on the shopping list.

Control Units

Control units are the bit of equipment that generates all the fun. We currently produce 4 units, all designed to complement each other

Series 2.

The EBox Series 2 to give its full title is our latest and most advanced E-Stim unit. It is purpose designed to offer considerably more than any other unit on the market today, the Series 2 is a must have for anyone interested in Electro Play, at any level. With dual isolated output channels, backlight LCD display with controls in English (no more funny codes), multiple program modes, a built in microphone and true stereo audio processing, all put together with serious levels of power, the Series 2 is turning out to be a world beating best seller.

The Series 2 is designed to be simple to use, but also offers the more advanced options lacking on my E-Stim equipment. A powerful made for play E-Stim unit. If you want the best then look no further.

Series 2

EBox Series 1.

The EBox Series 1 is a single channel dual output model designed to be simple but effective. This is NOT a rebadged TENS unit, but a durable made for play unit that since its conception has turned out to be our most popular unit. It offers power and flexibility at a very reasonable price. It has a wider range than similar units on the market, both in terms of control and power. With built in current limiting and stepless level controls, It's also the only E-Stim unit currently on the market with a 'Fire Button' offering precise manual control, as well as the more automated pulse and continuous modes.

Series 1

EBox Series 1 Remote

Remote Kit

Next in the line-up is the EBox Series 1 Remote. The Series 1 Remote is one of the smallest E-Stim remote controls on the market, offering a number of unique features. With a radio controlled digitally encoded keyfob (no more interference from other units) and 80M range the remote also offers similar levels of functionality to the Series 1, controlled from a small discreet keyfob controller. It also has the unique ability to link up with other transmitters allowing more than one transmitter to control more than one receiver (or one receiver responding to more than one transmitter), assuming of course you want it to.

The ABox

Lastly we come to our ABox. The ABox is the only dedicated sound driven E-Stim unit on the market, offering audio driven E-Stim. A single channel dual output unit, that uses sound to generate the output. With a built in adjustable sensitivity microphone and the ability to use external sources (MP3 players etc), as well as a bright level control and step less output adjustment, the ABox puts voice or music controlled E-Stim into the playroom. Not just using the amplitude (loudness) of the sound, but also the frequency (tonal nature) the ABox is flexible, versatile and unique.

ABox

Electrodes

Electrodes made for E-Stim fall into two types, unipolar and bipolar. Put simply in order to feel anything from E-Stim you need two points of contact, the current generated by the control unit flows between these two points and that is felt as a sensation. A unipolar electrode has a single contact, a bipolar electrode has two. It is possible to combine unipolar and bipolar electrodes together (for instance use one unipolar sound and a single contact of a bipolar plug).

All of our E-Stim kits are shipped with 4 reusable sticky pads, and the necessary cables, giving your purchasers the ability to start to play as soon as they get home. In addition we also offer all of our E-Stim kits with either a Veriprobe or a set of adjustable cock straps, again together with all the extra cables needed.

For people seeking electrodes we offer the choice between a number of low cost electrodes, and a higher specification premium range. Our premium range of electrodes are manufactured by us here in the UK from solid metal alloy bar stock, and assembled with medical grade polymers and stainless steel fittings. We don't believe in cheap chrome plating so we generally don't use it. The connectors are heavyweight 4mm with the sockets drilled directly into the conductors. And all of our premium electrodes are supplied with the correct cable.

The majority of our premium range of electrodes have contact points top and bottom. We have found this offers a more natural feeling when the electrode moves within the body as well as offering the optimum size of contact area.

Cock Straps

Electro bands, 'blue bands' 'cock straps', are all common names for the same item. Two flexible conductive fabric straps that fit around the penis and then connect to the control box. They are flexible, fit nearly all sizes (and that includes from flaccid to stiff!), generally without adjustment.

Cock Straps

We don't stock steel cock rings. Although they are popular on the E-Stim market we have always found they never fit correctly, (or they do when fully erect, but fall off 5 minutes later)

VeriProbe &
Femilux

VeriProbe and Femilux

The simplest insertable is the VeriProbe (and the slightly newer Femilux). Simple cheap and easy to clean, they work well for both vaginal and anal use. No additional cables are needed as they operate with the standard 2mm cables provided with all of our kits.

Flanged base electrodes

The most popular in our premium range is the Flanged electrode and its bigger sister the Mona. With a large flanged based both these electrodes offer comfort and durability, as well as the additional security of a flanged base.

Mona

Small Torpedo

Torpedoes

If a customer is looking for something larger then the torpedoes should fit the bill. The small torpedo is 1½" in diameter the larger torpedo is 2". Both are bipolar, but offer a serious fullness feeling when worn.

OMG

Looking for something even bigger? OMG (it stands for Oh My God!!) is currently our largest electrode, weighing over 2Kg and 3" in diameter. We started to manufacture OMG as a display piece, but people keep buying them. If you are looking for a attractive centrepiece for an E-Stim display, then consider the OMG.

Pinwheels and Sounds and more

We don't just produce a range of insertables. We also provide a range of exclusive urethral sounds (for insertion into the penis) and bipolar clips, tweezers and pinwheels for use on the surface of the skin. See our website or give us a call for the complete range.

Dual PinWheel

Everything else

We stock a wide range of cables, gels adaptors and other bits and pieces, all designed to enhance the E-Stim experience. We also produce a wide range of adaptors designed to allow users to use our equipment with that produced by other manufacturers.

Dos and Don'ts

Safety

We strongly believe in safe play. E-Stim offers an increased risk. All of our equipment is designed and built to the latest EU and US safety standards, normally applied to medical equipment, and is also CE marked, a legal requirement if equipment is to be sold in the UK or EU.

The general rule of thumb for E-Stim kit, and not just that produced by us, but all e-stim equipment is play below the waist. Passing current across the heart/chest area can cause disruption, especially with anyone fitted with pacemakers, infusions pumps etc. Nipple to nipple play is inherently risky and should not be attempted.

We would also advise against combining sexual intercourse with E-Stim play as again it's hard to ensure that current does not pass across the chest.... from a wired up partner touching another.

Piercings

Connection to piercing is possible, but can cause issues if the piercing is relatively new or high levels of E-Stim are used.

Cleaning

Electrodes do not work with a condom. All our electrodes can be cleaned with medical grade cleaning wipes and hot soapy water, provided everything is dry before storage.

THE END!!

Hopefully this has answered a few of your questions, but if there is anything you need to know, or wish to comment on, then please drop us a line. Our reputation has been built on us listening to our customers, we intend to continue listening, improving and offering the best equipment and service we can. I hope you can help.

I look forward to hearing from you soon.

Manv thanks
